

Prezentare coordonator

1. Conducator de doctorat: Avram Nicolae

2. Scurta descriere a domeniului de cercetare “Modelare si simulare in spectroscopie”.

In cadrul acestui domeniu de cercetare se desfasoara activitati vizand:

- Modelarea si simularea de proprietăți structurale, electronice, optice si spectrale ale unor materiale de interes tehnic (cristale, sticle, ceramici, nanomateriale), pure sau dopate cu ioni ai metalelor de tranziție;
- Modelarea parametrilor câmpului cristalin si ai Hamiltonianului de spin si simularea schemelor nivelelor energetice si a tranzițiilor dintre ele pentru ionii metalelor de tranziție;
- Simularea proprietăților spectrale ale unor materiale optice (oxizi, fluoruri) dopate, folosind primul principiu;
- Extragerea parametrilor câmpului cristalin pe baza unor metode *ab initio* CASSCF si multireferințiale;

3. Tema de cercetare pentru studiul doctoral si bibliografia aferenta:

“Obtinerea de noi informatii despre proprietatile spectrale ale spinelilor normali (Mg, Zn)Al₂O₄ dopati cu Cr³⁺/ Co²⁺ folosind metode multireferintale”.

4. Teme propuse pentru proba de specialitate la admitere si bibliografia aferenta (de regula 5 subiecte):

- Simetria cristalelor, grupuri de simetrie;
- Spectrele atomilor liberi cu mai multi electroni;
- Spectrele ionilor metalelor de tranzitie dopati in cristale;
- Notiuni de baza DFT;
- Metode ab initio aplicate la cristale dopate;

1. PhD supervisor: Avram Nicolae

2. Brief description of the research field "Modeling and simulation in spectroscopy".

Within this field of research, activities are carried out aiming at:

-Modeling and simulation of structural, electronic, optical and spectral properties of materials of technical interest (crystals, glasses, ceramics, nanomaterials), undoped or ion-doped transition metals;

- Modeling the parameters of the crystalline field and the spin Hamiltonian and simulating the schemes of energy levels and the transitions between them for the ions of transition metals;

- Simulation of the spectral properties of doped optical materials (oxides, fluorides), using the first principle;

-Extraction of the crystal field parameters based on ab initio CASSCF and multireference methods;

3. Research topic for doctoral study and related bibliography:

"Obtaining new information about the spectral properties of normal (Mg, Zn) Al₂O₄ spinel doped with Cr³⁺ / Co²⁺ using multi-reference methods."

4. Proposed topics for the special exam at admission and the related bibliography (usually 5 subjects):

- Symmetry of crystals, symmetry groups;
- Spectra of free atoms with many electrons;

- Spectra of transition metal ions doped in crystals;
- DFT basics;
- Ab initio methods for doped crystals;
